A pest logbook is a resource for your team to accurately log any signs of pest activity for your campus. This is helpful in allowing your service technician to review all pest activity since the last visit and where it occurred while also allowing you to keep record of when corrective actions were taken.

Having a logbook is an essential feature to any Integrated Pest Management (IPM) program that is used to document any important information about policies and procedures concerning pest control throughout the campus and its facilities.
